

System Stats

System capacity	247.8 kWp
Type of system	15° tilt fixed ground mount
Product	Power Max 175C Wp solar panels
Date of Commissioning	May 2006
Location	Cucamonga Valley Water District; Rancho Cucamonga, CA

This 248 kWp SolarWorld system serves the Cucamonga Valley Water District in Rancho Cucamonga, California. Installed in 2006, the system has demonstrated remarkable performance in meeting the facility's energy needs. In fact, our superior solar technologies combined with the Inland Empire's climate resulted in the system producing 20% more energy than predicted.

Average annual energy yield (kWh/kWp)	1,525
Performance ratio	90.42%
Actual/predicted energy output	120%

NOTE: Values above are based on monitoring data spanning 4 consecutive years in service. Normalization based on measured irradiance values was used in the analysis. SolarWorld is not responsible for the O&M of this system.

The Key Metrics of Solar

The revenue generated from a PV system is wholly dependent upon its energy output, over the full 25-year lifespan of the system. Therefore, the key metrics for evaluating a PV system and a solar panel should be based on:

- Energy output
- Real-world performance

Two key parameters that provide this information are the **Energy Yield** for a particular site and the **Performance Ratio** of a solar panel or system. Both of these measures are based on data collected from systems in the real world, and both measures account for energy produced—not power measured at standard test conditions. By using standard performance parameters and system ratings based in reality, it is easier for investors to evaluate different proposals and technologies, giving them greater confidence in their own ability to procure and maintain reliable, high-quality systems while generating expected project returns.

Energy Yield

The Cucamonga System has delivered an average energy yield of 1,525 kWh/kWp during its past four years of service. For every watt of power installed, on average, almost 1.5 kWh of energy were produced.

About Energy Yield

The value of a project is driven by the amount of energy that can be produced from the amount of power installed. Energy Yield (kWh / kW) is a proven metric to evaluate system performance, and compare the predicted and actual energy produced by PV systems of differing size for a given site. It is based on

real-world conditions, with site-specific solar radiance and weather conditions taken into account, which makes it a better predictor of true performance than efficiency measured in laboratory conditions. The yield on energy has a direct impact on the financials of a project and can be used to calculate the “Economic Yield” of the system:

Performance Ratio

The Cucamonga PV plant performance ratio with the Power Max 175C modules is 90.42% over four years. This outstanding achievement is considered “first in class” by today’s industry standards.

About Performance Ratio

Another good measure of real-world performance is the Performance Ratio (PR). The PR essentially normalizes the Energy Yield for a system over the irradiance measured at the location of the system. This allows an investor or EPC to compare systems that may differ in design, technology and geographic location.

By normalizing the data with respect to the actual irradiance, it quantifies the overall effect of losses on the rated output potentially caused by inverter inefficiency, wiring, soiling and more. Unlike efficiency, PR uses real-world data to judge the performance of a module and power plant. Because of this, PR provides more confidence in ultimate financial returns when selecting solar panels for a project.

The industry standard for a high-performing system is up to 80%. The closer the PR value is to 100%, which cannot be achieved due to unavoidable losses, the more efficiently the PV plant is operating.

Predicted vs. Actual Performance

Engineering, procuring and constructing a large-scale PV system is a complex undertaking. It also comes with a certain level of risk in terms of delivering on the expected energy output and revenue. Sound system design that follows industry best practices and the selection of reliable equipment for each project are paramount to meeting stakeholder expectations.

Over the past four years, the Cucamonga system on average has outperformed the predicted design by

20%. This incremental, extra output of energy:

- Provides additional unexpected revenue
- Improves the ROI for the project
- Reduces the payback period
