

System Stats

System capacity	1,008.0 kWp
Type of system	20° tilt fixed ground mount
Product	Power Max 175C Wp solar panels
Date of Commissioning	January 2008
Location	El Dorado Irrigation District; El Dorado Hills, CA

This 1 MWp system serves the El Dorado Irrigation District in El Dorado Hills, California. The system has been producing energy to support the district's needs since January of 2008 with remarkable performance. Predicted energy output has been exceeded by 10% in the seasonal climate of Northern California.

Average annual energy yield (kWh/kWp)	1,591
Performance ratio	85.41%
Actual/predicted energy output	110%

NOTE: Values above are based on monitoring data spanning 2 consecutive years in service. Normalization based on measured irradiance values was used in the analysis. SolarWorld is not responsible for the O&M of this system.

The Key Metrics of Solar

The revenue generated from a PV system is wholly dependent upon its energy output, over the full 25-year lifespan of the system. Therefore, the key metrics for evaluating a PV system and a solar panel should be based on:

- Energy output
- Real-world performance

Two key parameters that provide this information are the **Energy Yield** for a particular site and the **Performance Ratio** of a solar panel or system. Both of these measures are based on data collected from systems in the real world, and both measures account for energy produced—not power measured at standard test conditions. By using standard performance parameters and system ratings based in reality, it is easier for investors to evaluate different proposals and technologies, giving them greater confidence in their own ability to procure and maintain reliable, high-quality systems while generating expected project returns.

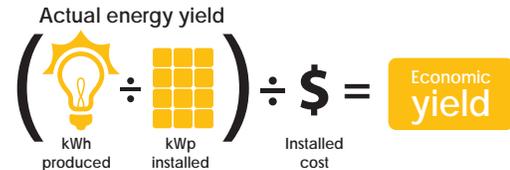

Energy Yield

The El Dorado system has delivered an average energy yield of 1591 kWh/kWp during its past two years of service. For every watt of power installed, on average, almost 1.6 kWh of energy were produced.

About Energy Yield

The value of a project is driven by the amount of energy that can be produced from the amount of power installed. Energy Yield (kWh / kW) is a proven metric to evaluate system performance, and compare the predicted and actual energy produced by PV systems of differing size for a given site. It is based on

real-world conditions, with site-specific solar radiance and weather conditions taken into account, which makes it a better predictor of true performance than efficiency measured in laboratory conditions. The yield on energy has a direct impact on the financials of a project and can be used to calculate the "Economic Yield" of the system:

Performance Ratio

The El Dorado PV plant performance ratio with the Power Max 175C modules is 85.41% over two years. This is great performance and certainly above today's industry standards.

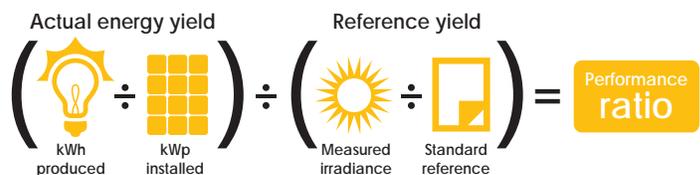

About Performance Ratio

Another good measure of real-world performance is the Performance Ratio (PR). The PR essentially normalizes the Energy Yield for a system over the irradiance measured at the location of the system. This allows an investor or EPC to compare systems that may differ in design, technology and geographic location.

By normalizing the data with respect to the actual irradiance, it quantifies the overall effect of losses on the rated output potentially caused by inverter inefficiency, wiring, soiling and more. Unlike efficiency, PR uses real-world data to judge the performance of a module and power plant. Because of this, PR provides more confidence in ultimate financial returns when selecting solar panels for a project.

The industry standard for a high-performing system is up to 80%. The closer the PR value is to 100%, which cannot be achieved due to unavoidable losses, the more efficiently the PV plant is operating.

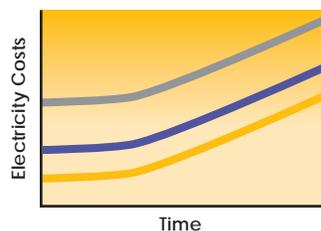

Predicted vs. Actual Performance

Engineering, procuring and constructing a large-scale PV system is a complex undertaking. It also comes with a certain level of risk in terms of delivering on the expected energy output and revenue. Sound system design that follows industry best practices and the selection of reliable equipment for each project are paramount to meeting stakeholder expectations.

Over the past two years, the El Dorado system on average has outperformed the predicted design by

10%. This incremental, extra output of energy

- Provides additional unexpected revenue
- Improves the ROI for the project
- Reduces the payback period
